

Acoustic blockchain improvements

1. Handle

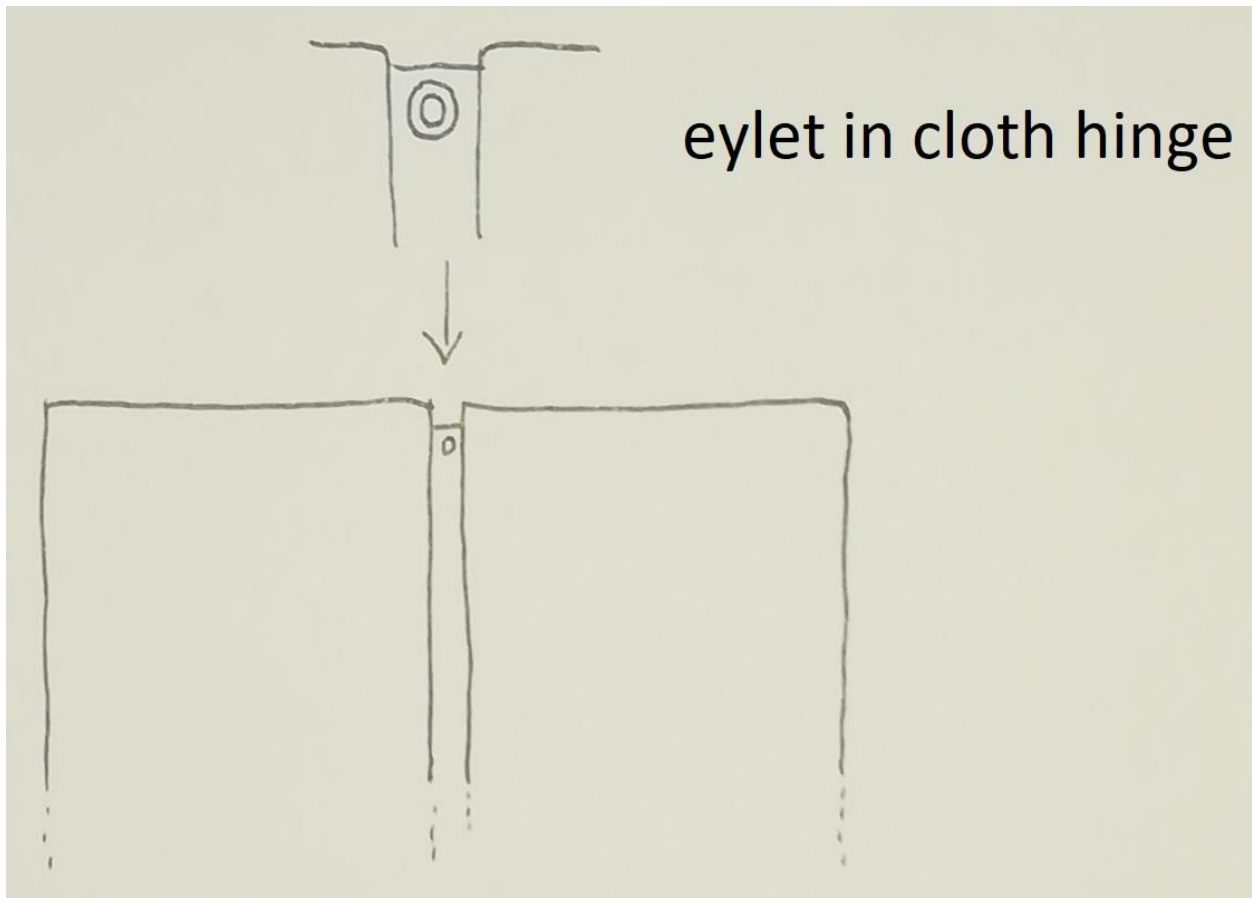

End pieces of blockchain should have a handle to make moving and setting it up easier.
I thought that an angled handle would allow many ways to grab it and that it could be sewn into side seams making it stronger.

2. Improved cloth

The ground facing side or even the lower part of each block could be made from moist/dirt resistant cloth to improve durability.

3. Eyelets

Cloth hinges form a natural strong point in construction. By adding eyelets to the top of these hinges the blockchain can easily be hung to a wall either for storage or as an acoustic treatment. All you need is two nails.

4. Transportation bag

The bag could be made simpler, for example something like a “sailor’s bag”. This kind of bag could be easily pulled over the blockchain making packing it a breeze.
